Re: Company profile

Nex Line S.r.l., established in 1993, is a company specialized in machining extruded aluminium profiles.

We can do CNC-machining on profiles belonging to our customers, but also manufacture a complete product from scratch, based on our customers' drawings. Cutting, punch pressing, CNC milling are some of our main offerings.

Our typical customer is a company who wants to have the least possible number of subcontractors, reducing the costs of logistics.

Starting from a customer's drawing, for example, we can manufacture a machined and assembled frame, including surface treatment (liquid or

powder painting, anodizing, and other special treatments).

With an order for the finished product, we will prepare the profile die, extrude the profile, cut and machine the pieces, assemble the frame and paint it. Nex Line is responsible for each one of these steps, and keeps them under control with an ISO 9001:2008 certified quality system.

In almost twenty years we manufactured over 800 different types of profiles, weight ranging from 30gr/meter up to 7800gr/meter. With 9 single and double mitre saws, 3 CNC milling machines (3 and 5-axis, for profiles up to 7 meters), 4 punch presses (20, 30, 40, 50 tons) we can produce many different types of products. You can find some examples on our website: <http://www.nexline.com/machining>

Our production capacity is very flexible, with lot sizes ranging from few hundred pieces per year up to tens of thousands of pieces per year.

We have vast experience in the field of indoor lighting.

The Nex Line group plant covers a total surface of 3500 square meters, and delivers about 700 tons of aluminium per year, with an annual revenue of more than 5M€(2010).

Contact us for a quote at info@nexline.com, or come and visit us, we are very close to the Ospitaletto exit on the A4 highway.
